Compulsory Rules Boundary: C28 Receivables Follow-Up Desk

Oct 17, 2026 · @insect

The company files set 31 rules we must follow. Break one and we lose points or credibility. They come from the starter README, the C28 README, `fixture.json`, the C28 card in `case-bank.json`, the judge notes, the templates and the problem statement you shared. Our own design choices are listed separately in Section 6 and can change; the 31 cannot.

1. Data and fixture rules

ID	Rule	Source	How we comply
R1	Preserve the reference inputs. Never edit `fixture.json`	Starter README	Read-only loader (spec F3). Extra rows live in a separate file
R2	Extra rows must be clearly labelled synthetic and use the same schema	Starter README	`data/extra_synthetic.json` with `"synthetic": true` and "added by team"
R3	Add our own negative test	Starter README	A named negative test (for example a negative amount or a null `due`) in `tests/`
R4	null means unknown, never zero	`fixture.json`	A null amount, received or due flags the row. Never default to 0
R5	Units: `_inr` is INR, dates are ISO, `_days` are calendar days. Use the stated as-of date	C28 README	Read `records.as_of` as the default. Show amounts in INR
R6	Do not combine the fixture with the old MBA workbook without an explicit mapping	C28 README	We do not use the old workbook

ID	Rule	Source	How we comply
R7	Judges vary inputs within the same published schema and product scope	C28 card, `test_scope`	The loader tolerates optional keys, unknown keys and null values

2. Product scope rules

ID	Rule	Source	How we comply
R8	Deliver the four outcomes: import invoices and receipts, calculate the overdue balance, separate disputes, draft a reviewable follow-up plan	C28 card	Spec F1, F4 to F8, F11 to F14, F18
R9	Pass the three public checks (10, 10 and 5 points): 10000 with 4000 received gives 6000; paid invoices leave the list while disputed balances stay visible in review; changing the as-of date updates ageing consistently	C28 card, `fixture.json`	Spec F4, F10, F14, F9. Tests 1, 2, 5, 9, 10, 25
R10	Handle the four edge cases: partial payment, unapplied receipt, disputed amount, promise-to-pay already received	C28 card	Spec F5, F6, F11 to F16
R11	Do not treat disputes as routine non-payment	C28 card, goal	Disputed part held in Under Review and never chased
R12	Follow-up is a reviewable draft	C28 card, problem statement	Drafts labelled "DRAFT - not sent", editable, never sent (F18)

ID	Rule	Source	How we comply
R13	Negotiated product change: add disputes and partial receipts to collection priority. Save the starting state, the negotiated scope and the final evidence	Problem statement	`starting_state.json` and `evidence_log.md` (F22)
R14	Do not silently add a new feature requirement	Judge notes	Every addition beyond the card is written in the evidence log as team scope with the reason

3. Claims and honesty rules

ID	Rule	Source	How we comply
R15	Do not claim recovered cash from a draft	C28 card, pilot	No cash-recovery figure anywhere in the app, doc or pitch
R16	No claim of live revenue or production readiness from synthetic data. Demand, willingness to pay and production performance are unproven	Problem statement, `fixture.json` limit	Footer and evidence log carry this statement (F24)
R17	Separate observed evidence from assumptions	Problem statement	Observed and Assumed columns in the evidence log. Weights go under Assumed
R18	Model calls are optional, but a fallback must be declared	Starter README, judge notes	README and footer state that drafts use templates and no model

ID	Rule	Source	How we comply
R19	Public checks are transparent reference tests, not a secret accuracy benchmark	Judge notes	We describe them as reference tests, never as an accuracy benchmark
R20	Pilot basis is read-only records with finance review. Measures are reconciliation accuracy and staff effort	C28 card	App stays read-only. Real measurement is a team pilot activity, not claimed from the demo

4. Process, evidence and handoff rules

ID	Rule	Source	How we comply
R21	At MBA entry, save a demo or screen recording, current tests, known gaps, backlog and the contributor list. Record the business team's joining time and baseline	C28 card, `snapshot`	`output/snapshot_at_mba_entry.md` plus the recording
R22	Only case ownership and rosters are frozen. Product negotiation and evidence can continue until submission	Judge notes	Keep the evidence log updating until we submit
R23	Handoff: record the handoff link, engineering acknowledgements and prior work credited in the transfer log. Record individual consent and verify roster eligibility	Templates, `Negotiation_and_Transfer_Log.csv`	Both tracks fill the log. Handoff link points to the repo README
R24	Do not poach people. Record consent. A constructive declined offer counts well	Judge notes	Any move of a person is consented and logged in `Roster_Register.csv`
R25	The MBA comparison is baseline to final: what was inherited, what changed. An inherited prototype does not earn business points by itself	Judge notes	Evidence log shows the baseline and the final change separately
R26	Every participant answers one contribution question	Judge notes	Commits carry the owner and feature ID. Each member can explain own modules

5. Testing and judging rules to be ready for

ID	Rule	Source	How we comply
R27	Judges run the reference calculation, then one changed-input challenge: change one stated input and keep the rule (date past a boundary, a missing required field, a repeated confirmed action). They write the expected behaviour first	Judge notes	The app never crashes on a changed input. Challenges and expected behaviour are in the analysis doc
R28	At the 9 AM market shock, everyone gets the same window and a change from the card's edge cases. They grade the response, the trade-off, the changed product and the business consequence	Judge notes	Shock drill in the work plan. Core and app changes are quick to make
R29	Engineering score out of 100: working journey 25, case checks 10, 10 and 5, reliability 15, business-feedback improvement 15, handoff 10, individual contribution 10. Points = weight × rating (0 to 4) ÷ 4	`Judging_Rubric.csv`	Build in this order: journey and the three checks first, then reliability
R30	The first-round timing in the notes is proposed: three rooms, ten teams each, seven minutes per team (four presenting, three questions). Alternative timing must be published before the event	Judge notes	Check the organisers' final announcement

ID	Rule	Source	How we comply
R31	The pack creates no prizes, internships or production guarantees	Judge notes	We make no such promise in any material

6. Our own choices (not company rules)

These come from the AI build spec. They can change if the situation changes, but any change that adds a feature must follow R14.

- Stack: Python, Streamlit, pandas, pytest. No database, no LLM, no login, no sending of messages.
- Money uses `Decimal`. Business rules are pure functions that take `as_of`; nothing is stored.
- Dispute cause, resolution and credit, the promise fields and the priority score are team additions. The score weights (0.45, 0.35, 0.20) are assumptions.
- Out of bounds for us: interest or late fees, multi-currency, payment gateways, automatic receipt matching, any message sending.

7. Pack discrepancies to record as assumptions

Discrepancy	What we do
The outcome says "import invoices and receipts", but the fixture has one `received_inr` number per invoice and no receipt records	Treat `received_inr` as the receipts. Support an optional receipts list. Record this in the evidence log
The judge notes say each fixture has assumptions, but the C28 fixture has a `limit` note and no assumptions key	Use the `limit` note. Write our own assumptions in `docs/assumptions.md`
The case data list includes "agreed next action" and a dispute status, but the fixture has only a `disputed` true or false flag	`disputed = true` with no amount holds the whole balance in review. Cause, resolution and promise are optional, null by default

8. Self-check before submission

- [ ] `fixture.json` is unchanged and extra rows are in a labelled synthetic file (R1, R2).
- [ ] Our own negative test exists and passes (R3).
- [ ] Null values are flagged, never treated as zero (R4).
- [ ] The three public checks pass, and 6000 outstanding appears for INV1 (R9).
- [ ] All four edge cases work (R10).
- [ ] Drafts show "DRAFT - not sent" and nothing is sent (R12).
- [ ] The evidence log holds the starting state, negotiated scope, final evidence, and observed versus assumed (R13, R17).
- [ ] Every addition beyond the card is written in the log with a reason (R14).
- [ ] No cash-recovery, revenue or production-readiness claim appears anywhere (R15, R16).
- [ ] The README and footer declare the template fallback (R18).
- [ ] The MBA-entry snapshot and the handoff link are saved (R21, R23).
- [ ] A changed as-of date, a missing field and a repeated saved action all behave correctly (R27).
- [ ] Each member can answer a question about their own modules (R26).
